Example 3; Fig 19; 366pp; English.

The sequences given in W01320-24 represent the light chain variable regions (VH) of a series of antibody fragments (FAb's) which are immunoreactive with HIV glycoprotein gp41. This sequence represents the sequence of the clone, Dt 41 of These sequences represent light chains which bind to the heavy light chain clones given in W01315-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity tirre in an in vivo virus infectivity The MAD may be used for determining immunocompetence of a human anti-HIV mithody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage wer produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence R4316 neutralises HIVI
                                                                                                       Human immunodeficiency virus; HIVI; qlycoprotein gpl20; epitope: neutralisation; monoclonal antibody; kappa light chain; variable region; framework; complementarity determining region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Monocional antibody binding to V1/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

Example, Fig 11: 365pp: English.

The sequences given in W01261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAD's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JK2 gene clone, b5. A MAD containing this V sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/m1, and binds mature gpl20 preferentially over the precursor gpl60. The MAD antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 eltqspqtlsispqeratiscragqsissnylawyqqkpqapxlllygasnxatqipdr 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA segments encoding monoclonal antibody - which binds to gp120 and neutralises HIV, for treating AIDS, and for diagnosing and monitoring HIV infection
monitoring HIV infection
The inclosure, Page 74-75: 109pp; English.
The nucleotide sequence of Fids Vk (042707 · sequence differs from other PIOS Vk sequences given elsewhere in the specification) was compared with germline gene Hinvists (442705), showing 97:7% similarity ky nucleotide sequence analysis. PIOS appears to be derived from a member of the Vk III subgroup gene family.

```
regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JTI gene clone, b24. A MAD containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gpl20 preferentially over the precursor gpl60. The MAD many be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the Mab regions on their surface. Panning with gp120 and gp41 resulted in the recovery of immunoreactive
                                                                                                                                                                                                                                                                                                                                                                                                             1 eltgspgtlslspgeratlscrasgsvisnylawyggkpggaprlliygvsnratgipdr 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The light chain VL region sequence R54277 neutralises HIV1
                                                                                                                             1 eltgspgtlslspgeratiscrasgsvisnylawyggkpggaprlliygvsnratgipdr 60

Human immunodeficiency Virus; HIVI; glycoprotein gp41: epitope: neutralisation; monoclonal antibody; light chain; variable region; framework region; complementarity determining region.
clones. The light chain VK region sequence R54307 is from a \ensuremath{\mathfrak{q}} 120^- specific clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lymphocyte mPNA was converted to cDNA and subjected to PCP amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Monoclonal antibody binding to V1/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.

Example 3: Fig 19, 365pp; English.

The sequences given in W01320-24 represent the light chain variable requires (VH) of a series of antibody fragments (Fab's) which are immunoreactive with HIV glycoprotein gp41. This sequences represents the sequence of the clone, G4.11. These sequences represent light monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 5.0% at a concentration of less than 700 ng of antibody/m1. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 aeltqspytlslspyeratlscrasqsvsngylawyqqkpyqaprlliygastratdipd 61

Mew human monoclonal antibodies neutralising HIV - react with gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy to diagnosis and for passive immuno-therapy texample; Page 180; 248pp; English.

Lymphocyte mRNA was converted to cDNA and subjected to PCR amphification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector. To produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Punning with gp120 and gp41 resulted in the recovery of immunoraactive clones. The light chain VK region sequence R54311 is from a gp120-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 eltgspgtlslspgeratlscrasgslsnnylawyqqkpgqapr1 \log 	ext{strgtqipdr} + 6 \mathbb{C}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ĉ
                                                                                                                  Monoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

Example: F1g 11: 366pp: Bng118h.

The sequences given in W1261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (Mab's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JK2 gene clone, B20. A Mab containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/m1, and binds mature gpl20 preferentially over the precursor gpl60. The Mab antibody and in the detection of HIV infection

antibody and in the detection of HIV infection

This ensures that the binding properties of the modified antibody are not diminished.
                                                                                                                                                                                                                                                                                                                                                                                                               1 eltgspgtlslspgeratlscrasgslsnnylawyggkpggaprlliygsstrgtgipdr 60

Mew human monocloud antibodies neutralising HIV - react with appl20 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy to the diagnosis and for passive immuno-therapy to the page 186-187; 248pp; English.

Lymphocyte mRNA was converted to CDNA and subjected to PCP amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library Filamentous phage were produced which expressed the MAD regions on their surface. Panning with appl20 and gp41 resulted in the recovery of immunoraactive clones. The light chain VK region sequence R54317 neutralises HIVI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             l qspqtlslspgeratlscrasqslsnnylawyqqkpqqaprlliygsstratgipdrfsg 60

                                                                                      10-NOV-1994 (first entry)
Anti-HIV dpl20 imminoglobulin light chain variable region s6
Human imminodeficiency virus: HIVI, dyroprotein gpl20, epitope;
neutralisation; monoclonal antibody, kappa light chain;
variable region: framework; complementarity determining region.

Monoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

Example, Fig 11: 366pp. English.

The sequences given in W01261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JX2 gene clone, s6. A MAB containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus intectivity assay by 50.8 at a concentration of less than To no of antibody, and him and a notively man antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 qspgtlslspgeratlscrasqslsnnylawyqqkpqqaprlliygsstratqipdrfsu 60

an immunoglobulin heterotetramer subunit consists of two identical light (kappa or lambda) and two identical heavy (alpha, delta, epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds; in some cases, such as IgA and IgM, the subunits associate into larger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4 mtqspsslsasvydivtitorasqsisaylnwyqkkpgkapklliysasslqsgvpsrfs 63

An immunoglobulin heterotetramer subunit consists of two identical light (kappa or lambda) and two identical heavy (alpha, delta, epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases, such as 1gA and 1gM, the subunits associate into larger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24 gmtgspsslstslgdrvtitcrasgsigtylnwyggkpgkapkfliygasslgsgvpsrf 83

In some cases, such as IgA and IgM, the subunits associate into larger oligomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Portolano, S.; Chazenbalk, G.D.; Hutchison, S.J.; McLachlan,

PS	Claim 7; Paqe 10-11; 20pp; Japanese.
<u>ر،</u> ر	W13921-W13928 represent the sequences for the heavy and light chains of
O C	the human monoclonal antibodies of the invention. The antibody of the
CC	invention preferably contains the sequence represented by W13912 in the
ĐĐ	complementarity determining region-1 (CDR-1) of the heavy chain variable
ပ္ပ	region. The antibody of the invention also contains the sequence
C)	represented by W13913 in the CDP·3 of the light chain mariable region.
ن	The antibody is capable of binding to adr type hepatitis B (HB) virus
ij	antigen. A human anti-HB virus mencelonal antibody preparation which is
9	highly safe and is effective to adr type HB virus can be provided, asing
Ć.	the monoclonal antihody. It can also be used as a vaccine against HB
SS	infection.

Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with 9p120 and 9p41 resulted in the recovery of immunoraective clones. The light chain VK region sequence R54261 neutralises HIVI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           l eltqspsslsasvqdrvtitcrasqsissylnwyqqkpgkapklliyaasslqsgvpsrf 60

Monoclonal antibody binding to V1/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

Example, Fig 11: 365pp; English.

The sequences given in Wol261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the IV2 gene clone, b27. A MAb containing this VL sequence has the capacity to reduce HIV infectivity time in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The MAb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 eltgspsslsasvgdrvtitcrasgsissylnwyggkpgkapklliyaasslgsgvpsrf 60

Lymphocyte mRNA was converted to chNA and subjected to pcP amplification using primers specific for heavy and light chain variable requions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue rolls were inserted into a produced which expressed the MAD regions on their surface. Panning with qp120 and gp41 resulted in the recovery of immunoreactive.

The light chain VK region sequence R54260 neutralises HIV1
                                                  The present sequence is a human anti-tumour antigen monoclonal antibody (MAD) light chain variable region, useful in monoclonal antibody (MAD) light chain variable region, useful in medicine, pharmacology and blochomistry. The isotype of a MAD secreted by the human/human hybridoma HT was determined to be mu and kappa. Human MAD was purified, and the antigen recognised by human MAD CLN*igM identified by western blotting.
                                                                                                                                                                                                                                                                                                                                                                               10-NOV-1994 (first entry)
Anti-HIV gpl20 imminoglobulin light chain variable region b22.
Human immunodeficiency virus; HIVI; glycoprotein gpl20; epitope; neutralisation; monoclonal antibody; kappa light chain; variable region; framework; complementarity determining region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 107;

This sequence represents the sequence has the gene clones, b22 and B35. A MAb containing this VL sequence has the capacity to reduce HIV infertivity title in an in vivo virus infectivity assay by 50. A a concentration of less than 70% ng of antibody/ml, and binds mature gpl20 preferentially over the precursor gpl60. The MAb may be used for determining immunocompotence of a human anti-HIV antibody and in the detertion of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 eltgspsslsasvgdrvtitcrasgsissylnwyggkpgkapklijyaasslgsgvpsrt 60

VL region of HIV neutralising MAb, clone b22 and B35
VL region of HIV neutralising MAb, clone b22 and B35
MAb; HIV, human immunodeficiency virus; glycoprotein: gpi20; clone: virus infectivity assay; precursor gpl60: immunocompetence: human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Monoclonal antibody binding to VI/V2 1-up of HIV spi20 - used in passive immuno:therapy and detection of HIV infection. Example, Fig 11: 366pp: English. Fig 19: very monoclone in Wilson and the sequences given in W01261-92 represent the light chain variable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

Claim 5: Fig 2b(1): 184pp; English.

Claim 5: Fig 2b(1): 184pp; English.

This polypeptide sequence comprises the VL domain of human scFv antibody 2A-H11 (also known as 6H1), which is specific for from a light chain shuffle repertoire of a peripheral blood lymphocyte library. The antigen-binding domains of human artibodies (see W1552-40) to TGF beta-1 and/or beta-2 can be used comprise the adverse effects of TGF beta, such as (i) promotion of fibrosis (in dermal, ocular or Reloid scarring, lung fibrosis, arterial injury, proliferative retinopathy, retinal detachment, adult respiratory distress syndrome, liver cirrhosis, post myocardial infarction post-angioplasty restenosis, scleroderma, vascular disorders, ataract, glaucoma, or esp. neural scarring and cloment inflammatory diseases or macrophage pathogen infection).

Common of recombinant antigen-binding domains. These are highly specific, have low dissociation constants (pref. less than 5 nM)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 mtqspsslsasvgdrvtitcrasqqisnylawyqqkpgkapklliykastlesgvpsrfs 63

to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gpi20 preferentially over the precursor gpl60. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 eltgspsslsasvgdrititorasgtinnylnwyggkpgkapklllygasnlgsgvpsrf 50

The sequences given in W01261-92 represent the light chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Monoclonal antibody binding to \rm VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-NOV-1994 (first entry)
Anti-HIV gpl20 immunoglobulin light chain variable region B8.
Human immunodeficiency virus: HIV1, glycoprotein gpl20, epifope:
neutralisation: monoclonal antibody: kappa light chain;
variable region; framework; complementarity determining region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 635; DB 19; Length 108; Pred No 1.01e-36;
